Software Summary

The imaging and signature app is a vital component of the X100 application, serving the primary purpose of capturing an individual's face and signature during the account creation process. Its functionality is centered around facilitating the collection and verification of personal identity information

User Interface (UI)

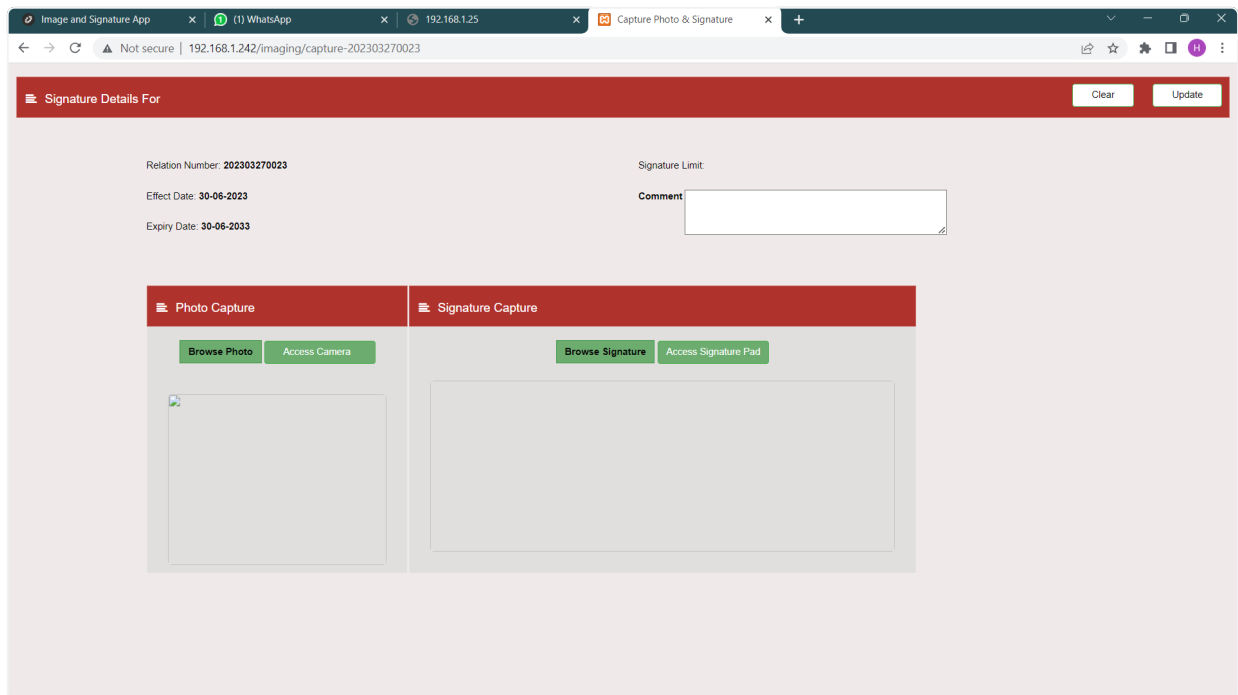

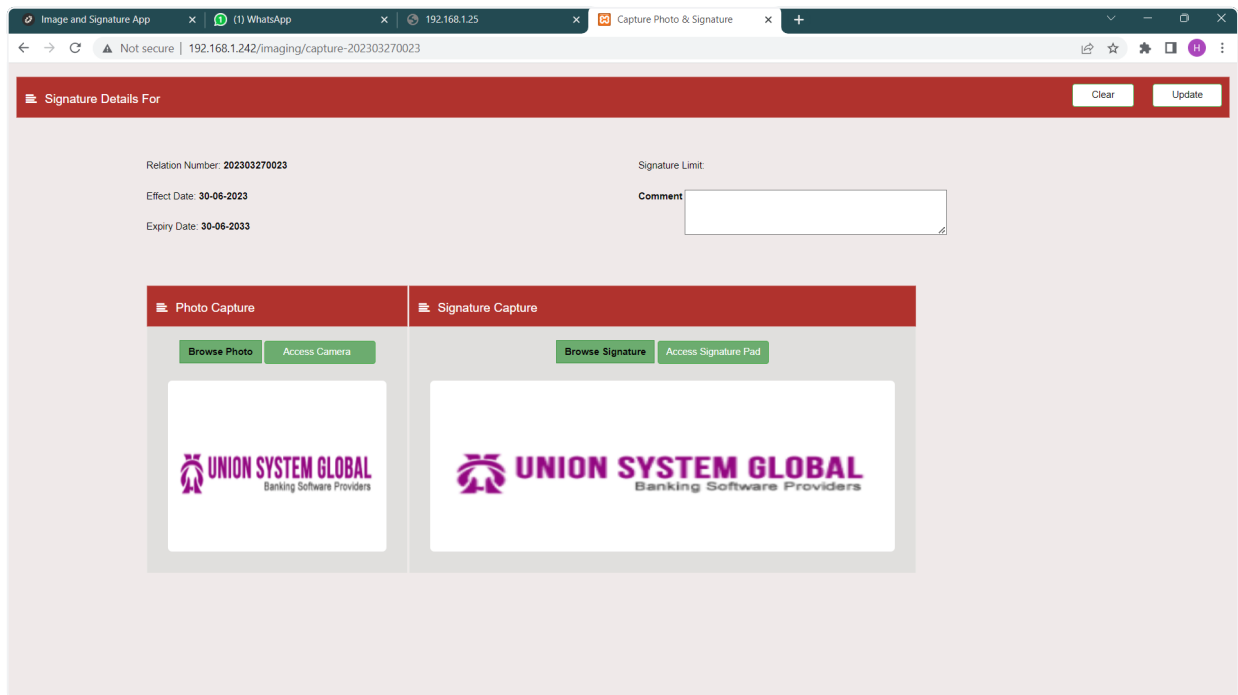

Image upload screen

Main Functionality (Data input and Output)

- Capturing images and signatures
 - a. During the signature and image capture session of account opening in x100, a php page is called with the relation number of the account to be opened and passed to the page (the capturing is done with JavaScript and displayed by html)
 - b. After the image and signature have been uploaded and the update button is clicked, the image and signature captured will be processed and stored in the database together with the relation number

- Approval of image and signature
 - c. During the approval of an originated account, when the view image and signature button is clicked in the x100 application, a relation number of the respective account is passed to an API, which retrieves the image and signature from the database and displays it with a php page for approval
- Backend and server-side operations
 - d. All images captured are stored in TBLSIG_DETAILS_TEMP
 - e. After approval, the images and signatures are moved to TBLSIG_DETAILS

Setup

- DATABASE CONNECTION
 - a. All connections in the image and signature apps must be made in the config.php file
 - b. Connect both the image and bankowner databases.

APIs

This is a list of all the APIs and what each one is responsible for

- 1 `http://{ip}/imaging/capture-{relation_number_goes_here}`
- 2 `//This api provides a screen for capturing of customers image and signature, it takes the relation in the url`

- 1 `http://{ip}/imaging/viewimage-{relation_number_goes_here}`
- 2 `//This api provides a screen for viewing of customers image and signature, it takes the relation in the url`

- 1 `http://{ip}/imaging/viewimage-{relation_number_goes_here}`
- 2 `//This api provides a screen for viewing the customer's image and signature, it takes the relation in the url`

hjjj

- 1 `http://{ip}/imaging/view_j_images-{account_number goes here}`
- 2 `//This api provides a screen for viewing the image and signature on the enquiry screen pass account number in the url`

Conclusion

This is a brief summary of how the image and signature app works
